The next generation wireless networks are expected to converge into a ubiquitous architecture, which includes high-speed cellular networks, wireless local area networks (WLANs), mobile ad hoc networks, peer-to-peer networks, wireless metropolitan area networks (WMANs), etc. The increasing demand of wireless multimedia services has motivated the development of broad wireless access in the heterogeneous wireless networks. Mobile subscribers can enjoy the high bit rate, low cost, ubiquitous coverage, and secure connection. For the next generation wireless networks, further extensive investigation, experimentation and development are necessary, such as capacity analysis/enhancement, quality-of-service (QoS) support, power saving, wireless routing, security, and mobility management. This special issue presents recent cutting edge research and state-of-the-art technology. The accepted eight papers are selected from the 2nd International Conference

on Broadband Networks (BroadNets'05, held in Boston, MA, Oct. 3–7, 2005), the 2nd International Conference on Quality of Service for Heterogeneous Wired/Wireless Networks (QShine'05, held in Orlando, FL, Aug. 22–24, 2005), and the 11th Mobile Computing Workshop (held in Taiwan, Mar. 31, 2005). These papers are timely and valuable for future analysis, implementation and experiments of heterogeneous broadband wireless networks.

In the first paper “Dynamic power saving mechanism for 3G UMTS system,” Yang investigates a power saving mechanism for Universal Mobile Telecommunications System (UMTS). Analytic and simulation models are proposed to study the two control parameters: discontinuous reception (DRX) cycle and the inactivity timer threshold. Optimal values of the two parameters in terms of maximum power saving are obtained. A dynamic algorithm is also proposed to enhance the performance of DRX.

In the second paper “Predictive dynamic channel allocation scheme for improving power saving and mobility in BWA networks,” Chen and Tan propose a signal-aware dynamic channel allocation (SDCA) to improve the channel utilization as well as to reduce the probability of out-of-service for IEEE 802.16 networks. The SDCA not only increases the capacity of the system but saves the overall power consumption of the system well. A location prediction scheme is presented to prevent the out-of-service effect on mobile subscriber stations due to user mobility.

In the third paper “Queue analysis and multiplexing of heavy-tailed traffic in wireless packet data networks,” Teymori and Zhuang investigate the queuing behavior of self-similar traffic flows for data applications in a packet-switching single-server wireless network. Close-form expressions are derived for the relation among the traffic parameters, the channel working state probability, the server capacity, and the queue distribution for an infinite

buffer size or the packet loss probability for a finite buffer size. Queueing behavior is also studied for a multiple-input system with a finite buffer size.

The fourth and fifth papers focus on cross-layer design approaches for wireless ad hoc networks. In the fourth paper “A cross-layer approach to channel assignment in wireless ad hoc networks,” Gong, Midkiff, and Mao propose a distributed channel assignment scheme to improve the capacity of wireless ad hoc networks. Through a joint design of channel assignment and routing protocols, the proposed scheme has the advantages of low communication, computation, and storage complexity. A multi-channel medium access control protocol is also presented, which is shown to substantially increase throughput and reduce delay. In the fifth paper “Joint design of routing and medium access control for hybrid mobile ad hoc networks,” Du and Wu present a new routing protocol, Hybrid Routing, which takes advantage of the powerful nodes in hybrid mobile ad hoc networks. The routing area is divided into multiple cells, and one powerful node is maintained in each cell if possible. Based on location information and cell structure, routing among the powerful nodes is efficient and simple. A hybrid medium access protocol is also proposed, which can improve the efficiency of medium access in hybrid mobile ad hoc networks.

In the sixth paper “A differentiated service model for enhanced distributed channel access (EDCA) of IEEE 802.11e WLANs,” Lee, Liao, and Chen propose a service mechanism called Differentiated Service-Enhanced Distributed Channel Access (DS-EDCA) for IEEE 802.11e WLANs. Delay and delay variation of the high priority traffic can be controlled, and at the same time, proportional bandwidth sharing among the best-effort traffic can be achieved. A hierarchical link sharing model is also presented.

The last two papers deal with network security. In the seventh paper “Privacy-enhanced, attack-resilient access control in pervasive computing environments with optional context authentication capability,” Ren and Lou propose a privacy enhanced anonymous authentication and access control scheme to secure the interactions between mobile users and services in pervasive computing environments with optional context authentication capability. The proposed scheme provides explicit mutual authentication between a mobile user and a service, and it also allows the mobile user to anonymously interact with the service. It is denial-of-service (DoS) resilient by requiring the user to prove its legitimacy when initializing a service session. In the last paper “On the impact of quality of protection in wireless local area networks with IP mobility,” Agarwal and Wang present a detailed experimental study to demonstrate the impacts of quality of protection on performance by integrating cross-layer security protocols in a wireless LAN testbed with IP mobility. It is demonstrated that the effects of security policies on QoS

parameters span a wide range. Suggestions are also given for the design of future security protocols for real-time services in wireless LANs.

In closing, the guest editors would like to acknowledge the contribution of many experts who participated in the review process and provided helpful suggestions to the authors on improving the content and presentation of the articles. The advice and support from Dr. Imrich Chlamtac, Editor-in-Chief, and Ms. Karen Decker are greatly appreciated.

Xuemin (Sherman) Shen received a B.Sc. (1982) degree from Dalian Maritime University, China, and M.Sc. (1987) and Ph.D. (1990) degrees from Rutgers University, New Jersey, all in electrical engineering. Currently, Dr. Shen is with the Department of Electrical and Computer Engineering, University of Waterloo, Canada, where he is a professor and the Associate Chair for Graduate Studies. His research focuses on

mobility and resource management in interconnected wireless/wireline networks, UWB wireless communications systems, wireless security, and ad hoc and sensor networks. He is a co-author of three books, and has published more than 300 papers and book chapters in wireless communications and networks, control, and filtering. He was Technical Chair for the IEEE GLOBECOM’07, ISPAN’04, QShine’05, IEEE Broadnets’05, and WirelessCom’05, and is Special Track Chair of the 2005 IFIP Networking Conference. He serves as Associate Editor for IEEE Transactions on Wireless Communications; IEEE Transactions on Vehicular Technology; Computer Networks; ACM/Wireless Networks; Wireless Communications and Mobile Computing (Wiley); and International Journal Computer and Applications. He has also served as Guest Editor for IEEE JSAC, IEEE Wireless Communications, and IEEE Communications Magazine. Dr. Shen received the Outstanding Performance Award from the University of Waterloo in 2002 and 2004, for outstanding contribution in teaching, scholarship and service, and the Premier’s Research Excellence Award (PREA) in 2003 from the Province of Ontario, Canada, for demonstrated excellence of scientific and academic contributions.

Phone Lin received his BSCSIE degree and Ph.D. degree from National Chiao-Tung University, Taiwan, Republic of China in 1996 and 2001, respectively. From August 2001 to July 2004, he was an Assistant Professor in Department of Computer Science and Information Engineering (CSIE), National Taiwan University (NTU), Republic of China. Since August 2004, he has been an Associate Professor in Department of CSIE and Graduate Institute of Networking and Multimedia, NTU, Republic of China. Since August 2005, he has been the chief of Division of Information Management, Computer and Information Networking Center, National Taiwan University. His current research interests include personal communications services, wireless Internet,

and performance modeling. Dr. Lin has published more than 20 international SCI journal papers (most of which are IEEE Transactions and ACM papers).

Dr. Lin is a Guest Editor for IEEE Wireless Communications special issue on Mobility and Resource Management, and a Guest Editor for ACM/Springer Mobile Networks and Applications Journal special issue on Broadnets. He is also an Associate Editor of IEEE Transactions on Vehicular Technologies and an Associate Editorial Member for the WCMC Journal. He is the winner of the 2005 Wu Ta You Memorial Award from National Science Council Taiwan, the winner of the 2004 Fu Ssu-Nien Award from National Taiwan University, the winner of 2004 K. T. Li young researcher award from ACM Taipei/Taiwan Chapter, and the winner of 2004 research award for young researchers from Pan Wen-Yuan Foundation. P. Lin is an IEEE senior member. P. Lin's website address is <http://www.csie.ntu.edu.tw/~plin>.

Yi-Bing Lin is Chair professor of Department of Computer Science and Information Engineering (CSIE), National Chiao Tung University (NCTU). He also serves as Vice President of the Office of Research and Development, NCTU. Dr. Lin is a senior technical editor of IEEE Network, an editor of IEEE Trans. on Wireless Communications, an associate editor of IEEE Trans. on Vehicular Technology, an editor of IEEE Wireless Communications Magazine, an editor of ACM/Baltzer Wireless Networks, Program Chair for the 8th Workshop on Distributed and Parallel Simulation, General Chair for the 9th Workshop on Distributed and Parallel Simulation, Program Chair for the 2nd International Mobile Computing Conference, Guest Editor for the ACM/Baltzer MONET special issue on Personal Communications, a Guest Editor for IEEE Transactions on Computers special issue on Mobile Computing, a Guest Editor for IEEE Transactions on Computers special issue on Wireless Internet, and a Guest Editor for IEEE Communications Magazine special issue on Active, Programmable, and Mobile Code Networking. Lin is the author of the book

Wireless and Mobile Network Architecture (co-author with Imrich Chlamtac; published by John Wiley & Sons). Lin received 1997, 1999 and 2001 Distinguished Research Awards from National Science Council, Republic of China, 2004 K.-T. Li Outstanding Award, 2005 Pan WY Distinguished Research Award, 2005 Teco Award, and 1998 Outstanding Youth Electrical Engineer Award from CIEE, Republic of China. He also received the NCTU Outstanding Teaching Award in 2002. Lin is an Adjunct Research Fellow of Academia Sinica, and is an Adjunct Chair Professor of Providence University. Lin is an IEEE Fellow, an ACM Fellow, an AAAS Fellow, and IEE Fellow.

Y. Thomas Hou obtained his B.E. degree from the City College of New York in 1991, the M.S. degree from Columbia University in 1993, and the Ph.D. degree from Polytechnic University, Brooklyn, New York, in 1998, all in Electrical Engineering. From 1997 to 2002, He was a researcher at Fujitsu Laboratories of America, IP Networking Research Department, Sunnyvale, California. Since Fall 2002, he has been an Assistant Professor at Virginia Tech, the Bradley Department of Electrical and Computer Engineering, Blacksburg, Virginia. His current research interests include resource (spectrum) management and networking issues for SDR-enabled wireless networks, optimization and algorithm design for wireless ad hoc and sensor networks, and video communications over dynamic ad hoc networks. In recent past, he also had worked on scalable architectures, protocols, and implementations for differentiated services Internet, service overlay networking, video streaming, and network bandwidth allocation policies and distributed flow control algorithms. He has published over 100 journals and conference papers in the above areas and is a recipient of the 2004 IEEE Communications Society Multimedia Communications Best Paper Award, the 2002 IEEE International Conference on Network Protocols (ICNP) Best Paper Award, and the 2001 IEEE Transactions on Circuits and Systems for Video Technology (CSVT) Best Paper Award. He is a member of ACM and a senior member of IEEE.
