

Acknowledgements

This thesis would not have been possible without the help of many people. Especially, I would like to thank my thesis advisor Professor Rong-Hong Jan, whose guidance inspired me with many ideas throughout this entire process. Thanks also to my colleague at Computer Network Laboratories, who provided great support on the research and my life during the past years. Besides, I would like to acknowledge Open-Source contributors from whom I obtained and modified the source codes used in my thesis.

Being a part-time student, I also work for a high-tech company. My supervisor Mr. Hudson Su gave me a lot of flexibilities at the work, which was a tremendous help. Last but not least, I also like to express my appreciation for my parents and girlfriend for their patience and love during my toughest time while doing research.
