

CHAPTER 6

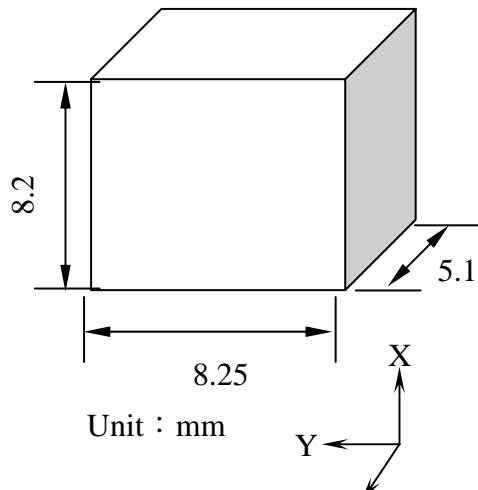

Future Works

Future Works

Low CTE Material

Aluminum Alloy (10XX)

Density of Aluminum : 2.72 g / cc

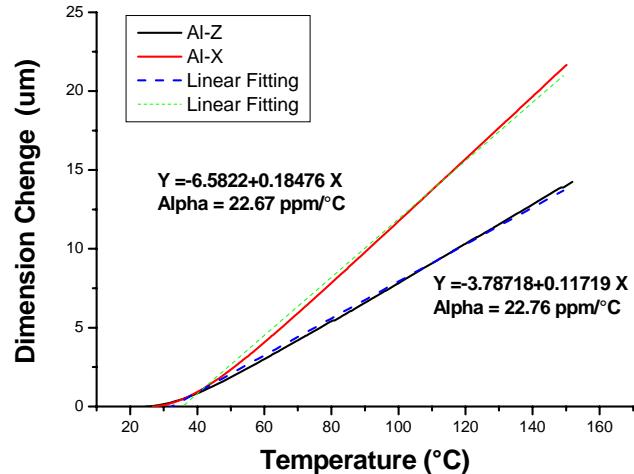

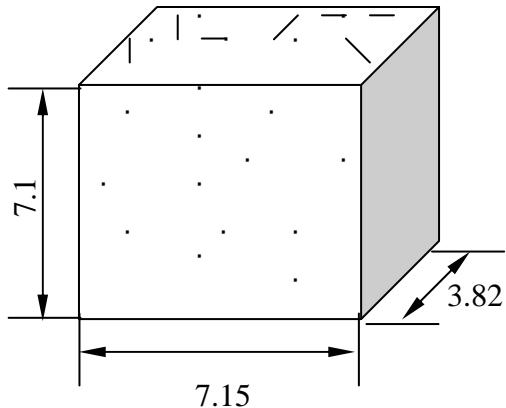

Fig. 1. Measurement of thermal expansion coefficient on aluminum from room temp. to 150 °C

Graphite short fiber / Aluminum Composite

$$V_{Al} (\%) = 95.11 \text{ and } V_{Gr} (\%) = 4.88$$

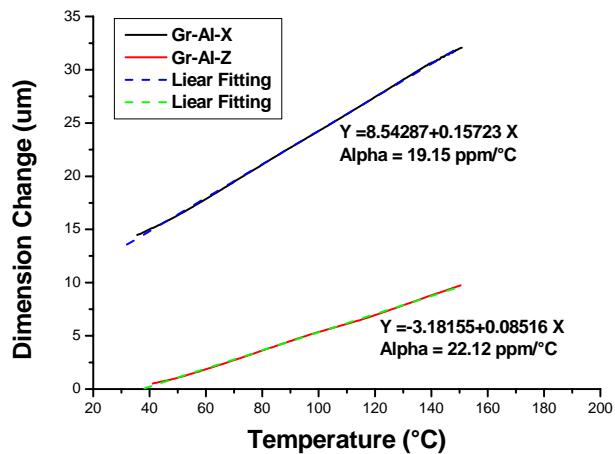

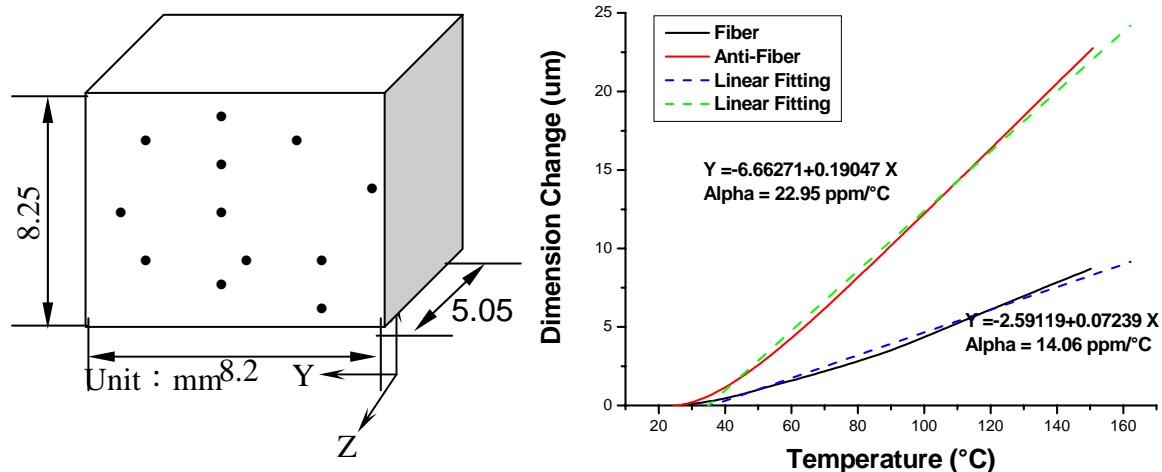

Fig. 2. Measurement of TEA on Gr/Al composite from room temp. to 150 °C

Graphite/Aluminum Composite

$$V_{\text{Al}} (\%) = 92.19 \text{ and } V_{\text{Gr}} (\%) = 7.81$$

Fig.3. Measurement of TEA on Gr/Al composite from room temp. to 150 °C

**But another CTE measurement was made with hi-modulus graphite
manufactured by TOSHIBA Ltd., Company.**

Gr/Al composite Fiber vol %	100	200	
12	13.89	14.77	(CTE)
24	4.89	4.96	(CTE)
36	3.98	4.11	(CTE)

Characters of CNT

Electrical conductivity -- probably the best conductor of electricity on a nanoscale level that can ever be possible.

Thermal conductivity -- comparable to diamond along the tube axis.

Mechanical -- probably the stiffest, strongest, and toughest fiber that can ever exist.

Chemistry of carbon -- can be reacted and manipulated with the richness and flexibility of other carbon molecules. Carbon is the basis of most materials we use every day.

Self-assembly -- strong *van der Waals* attraction leads to spontaneous roping of many nanotubes. Important in certain applications.

Electrical conductivity

Conductance Quantization $(12.9 \text{ k}\Omega)^{-1}$

Resistivity $10^{-4} \Omega\text{-cm}$

Maximum Current Density 10^{13} A/m^2

Mechanical property

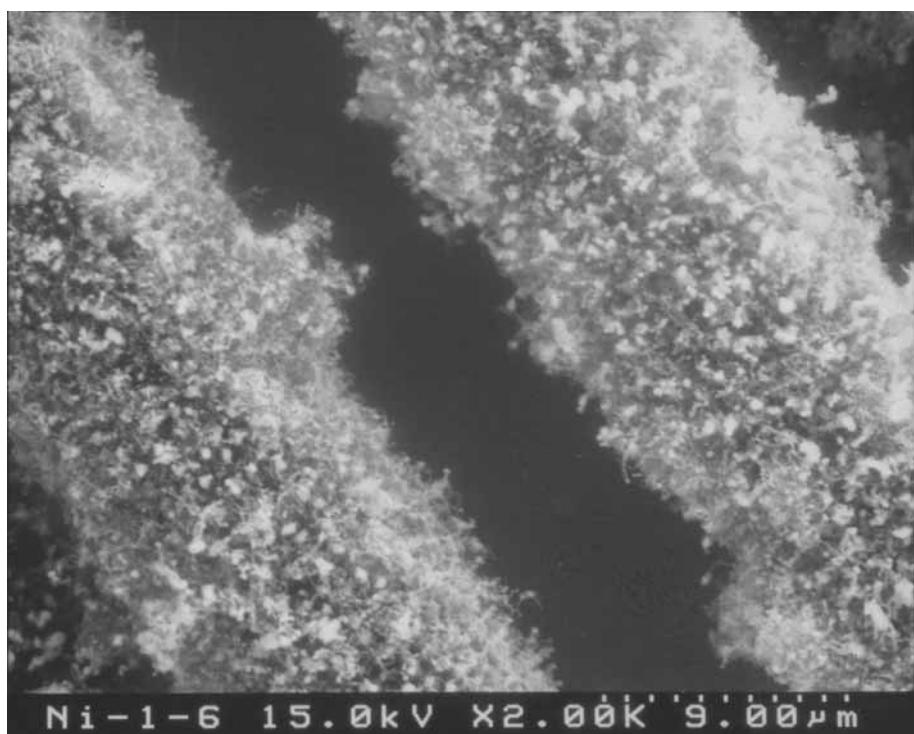

Elastic Behavior

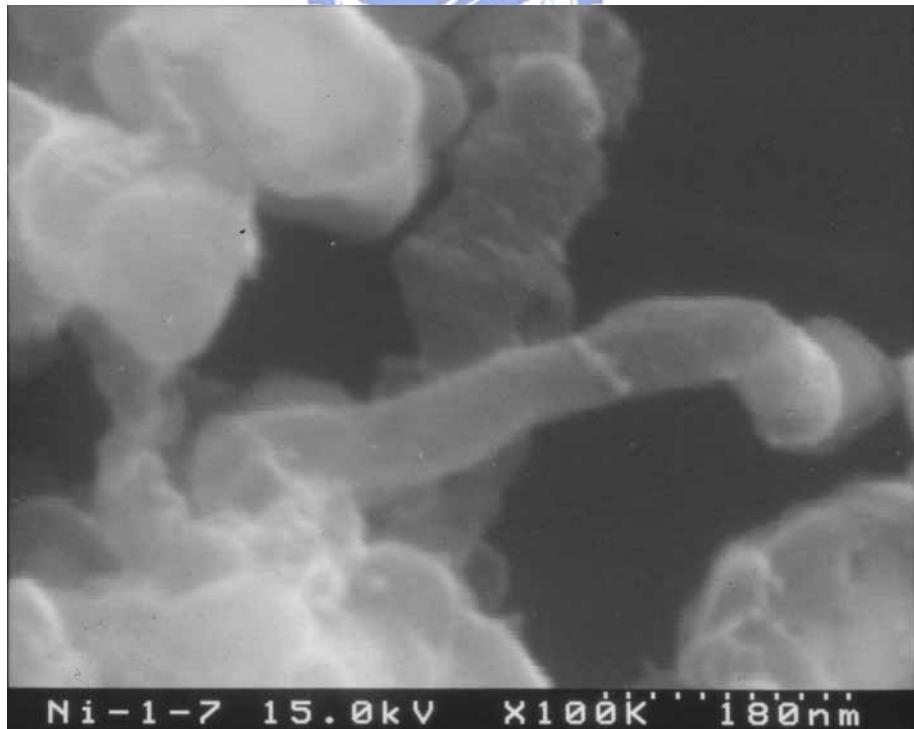

Young's Modulus (SWNT) ~ 1 TPa

Young's Modulus (MWNT) 1.28 Tpa

Maximum Tensile Strength ~ 100 GPa

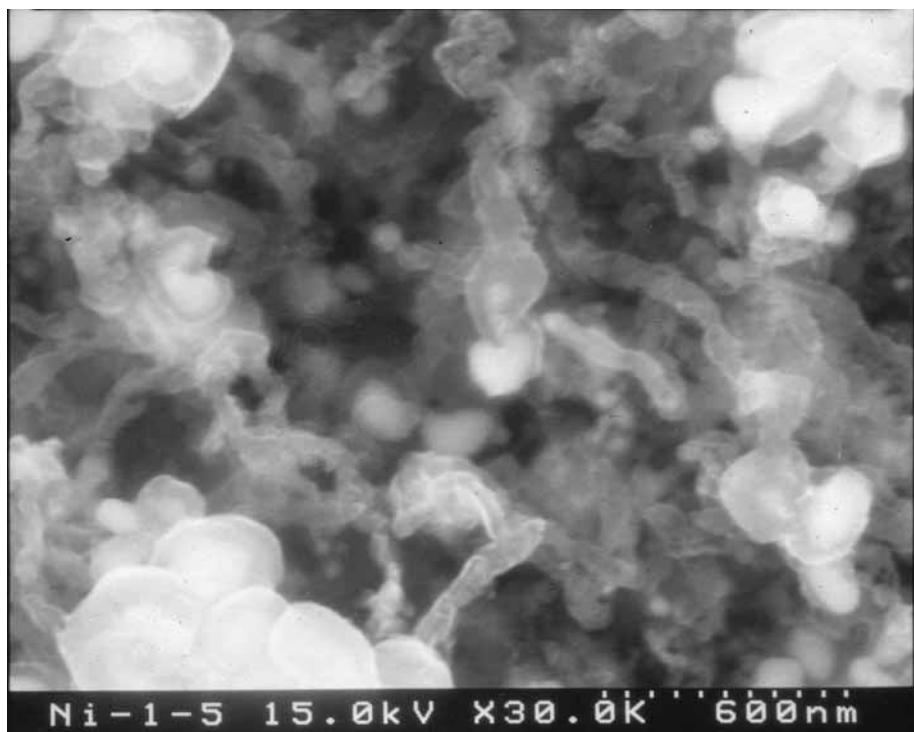

Ni-1-6 15.0kV x2.00K 9.00 μ m

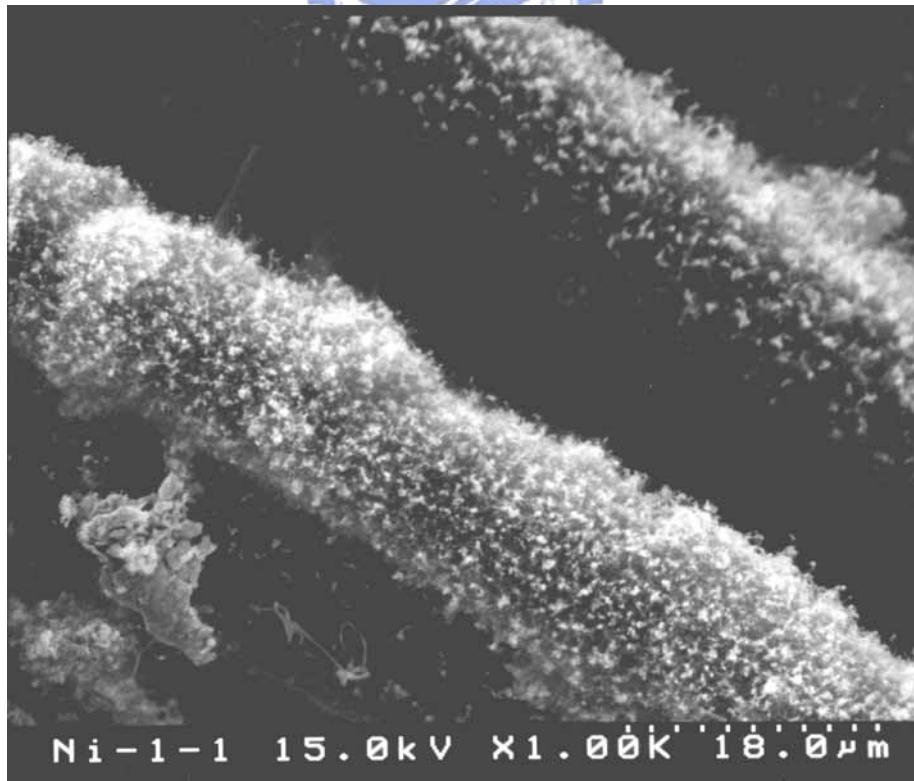

Ni-1-7 15.0kV x100K 180nm
