# Figure Caption

Fig. 1-1 Image pipeline stage of DSC ……...1

Fig. 1-2 Main steps of AE process ……2

Figs. 1-3 (a) Normal, (b) Overexposed and (c) Underexposed images ……4

Figs. 1-4 (a) Spot metering, (b) Mean metering, and (c) Center-weighted metering modes ……4

Figs. 1-5 Images in special lighting conditions: (a) Backlighting, (b) Strong frontlighting, (c) Highlight, (d) Dark environment ……...5

Fig. 2-1 Configuration of the major parts of the imaging system ……9

Fig. 2-2 The displacement of EV curve after EV compensation ……..14

Fig. 2-3 Exposure parameters are extracted from light meter ……15

Fig. 3-1 Gray level from dark state to bright state ……...17

Fig. 3-2 Light metering method based on constant gray value to control the exposure time ……..17

Fig. 3-3 AE system based on LUTs propose by Kuno et al. ……18

Fig. 3-4 Sampling area of the imaging sensor CCD ……19

Fig. 3-5 Configuration of LUTs with address value n ……20

Figs. 3-6 (a) The HIST distribution of the normal lighting state and (b) The HIST distribution of the backlighting state ……..23

Fig. 3-7 The features of HIST information in high contrast conditions ……...23

Figs. 3-8 (a) Photography and histogram in normal lighting state and (b) Photography and histogram in backlighting state ……25

Fig. 3-9 High chroma images: (a) Background with blue sky before exposure compensation and (b) Background with white sky after exposure compensation …..27

Fig. 3-10 Low chroma images: (a) Background with gray clouds before exposure

compensation and (b) Background with white clouds after exposure compensation .27

Fig. 3-11 Low chroma images: waterfall become bluish due to wrong AWB …….27

Figs. 4-1 Photographs and histograms in special lighting conditions: (a) Highlight, (b) Backlighting, (c) Dark environment and (d) Strong frontlighting ……32

Fig. 4-2 Image database in the over_bound1 and lower_bound2 plane ……..35

Fig. 4-3 Image database in the angle and distance plane ……35

Fig. 4-4 Image database and membership functions of proposed 2-D scene analysis method ……38

Fig. 4-5 The compensation amounts of different lighting regions ……..…..38

Fig. 5-1 Experimental flow chart of luminance detection models ……...41

Fig. 5-2 Configuration of the light metering system in simulation ……42

Fig. 5-3 Linear regression of the experimental data ……44

Fig. 5-4 Small angle inclination of the optical axis ……45

Fig. 5-5 Experimental flow chart of scene analysis method .....……47

Fig. 5-6 Block diagrams of experiment and simulation configuration ……48

Fig. 5-7 Total distance of the gravities in different kinds of database ……50

Fig. 5-8 Total distance of the gravities of database in angle and distance directions ..50

Fig. 5-9 Plot of the percentage of image database as a function of angle ……..51

Fig. 5-10 Plot of the percentage of image database at as a function of distance ……52

Fig. 5-11 Schematic diagram of the AE simulation process ……53

Fig. 6-1 K value of Kuno model is a function of AGC gain (G), and mean integrated luminance signal value $\Sigma_m$ is a function of AGC gain (G) ……..57

Fig. 6-2 K value of Kuno model is a function of exposure time (T), and mean integrated luminance signal value $\Sigma_m$ is a function of exposure time (T) ……..57

Fig. 6-3 Constant K（offset）value as a function of F-number (A) ……58

Fig. 6-4 Constant K( offset )value as a function of exposure time T ……..……..59

Fig. 6-5 Constant K（offset）value as a function of gain value (G) ……..…….59

Fig. 6-6 K value as a function of EV in small angle inclination (EV = $\log_2(A^2/T)$), K value is a constant .....……..60

Fig. 6-7 offset value as a function of EV in small angle inclination (EV = $\log_2(A^2/T)$), offset value is a constant ……..……...61

Fig. 6-8 Light metering results of CS100 and Canon G5 (L ($cd/m^2$)) …….62

Fig. 6-9 Performance of the parameters in different partition methods, nx = number of partition regions in angle axis, ny = number of partition regions in distance axis …..63

Fig. 6-10 Results of degree of membership as a function of angle and five membership functions: VS, S, M, B, VB ……64

Fig. 6-11 Results of degree of membership as a function of distance and five membership functions: VS, S, M, B, VB ……65

Fig. 6-12 Results of compensation amount δEV for each region; δEV = $\log_2 (T_2/T_1)$, $T_1$: exposure time before compensation, $T_2$: exposure time after compensation ……65

Fig. 6-13 Results of defuzzified compensation amountδEV; δEV = $\log_2 (T_2/T_1)$, $T_1$: exposure time before compensation, $T_2$: exposure time after compensation, (angle is the ratio of dark to bright areas in a whole picture, and distance is the total ratio of dark and bright areas in a whole picture.) ……...66

Fig. 6-14 Results of defuzzified compensation amountδEV; δEV = $\log_2 (T_2/T_1)$, $T_1$: exposure time before compensation, $T_2$: exposure time after compensation ……..66

Fig. 6-15 Comparison of strong backlighting condition for different light metering methods, CW = Center-Weighted metering mode ……...68

Fig. 6-16 Comparison of backlighting condition for different light metering methods ……...68

Fig. 6-17 Comparison of strong frontlighting condition for different light metering

methods ……...69
Fig. 6-18 Comparison of normal lighting condition for different light metering methods ……..…..69
Fig. 6-19 Comparison of highlight condition for different light metering methods ...70
Fig. 6-20 Comparison of dark environment condition for different light metering methods ……..70
Fig. 7-1 Pictures and database in the transition region ……..74
