Chapter 1 Introduction 1

Chapter 2 Literature Review 3

2.1 Nonlithographic fabrication of nano-technolog 3

2.2 The characteristics and fabrication of nanoscal template 6

2.2.1 Electropolishing of aluminum 6

2.2.2 Anodizing of aluminum 8

2.3 Fabrication of nanowires and its application 14

2.4 The characteristics and fabrication of nanospheres 18

Chapter 3 Experimental Procedures 19

3.1 Electropolishing (EP) of aluminum foil 19

3.2 Anodic Aluminum oxide (AAO) 21

3.3 Fabrication of tin (Sn) nanowires 29

3.4 Methods of nanospheres process 32

Chapter 4 Results and Discussions 35

4.1 Electrochemistry of aluminum 35

4.1.1 Electropolishg of Al 35

4.1.2 Pourbaix diagram of Al 39

4.1.3 Anodization of Al 44

4.2 Comparison of AAO forming by two-step and one-step anodization 45

4.2.1 two-step anodization 45

4.2.2 one-step anodization 51

4.2.3 Self-diffusion of AAO 55

4.2.4 XRD characterization of Al and AAO 58

4.3 AAO growth on the silicon wafer and glass substrate 61

4.4 Defects on the AAO 66

4.5 Sn nanocrystals, whiskers, nanowires, particles and nanospheres forming inside (on) AAO 69

4.5.1 Injection of Sn into AAO forming nanowires 70

4.5.2 Formation of Sn whisker and particles on AAO 93

4.5.3 Formation of Sn nanospheres on AAO 101

4.5.4 Effect of superheating and cooling rate on nanosphere formation 105

4.6 Alloy nanowires and nanoparticles 107

4.6.1 Nanoparticles forming by thermal immersing method 107

4.6.2 Critical radius and free energy of alloy nucleation on

the AAO 110

4.6.3 Nanoparticle in concave 113

4.6.4 Nanoparticles growth and sintering 115

Chapter 5 Conclusions **122**

Chapter 6 Future works **124**

References **125**

Appendix 132

A.1 Electrochemistry of titanium 132

A.2 Electropolishing of Ti 135

A.3 Pourbaix diagram of Ti 139

A.4 Anodizing of titanium 140

A.5 Decomposition of ATO 148

Tables list

Tab. 2.1 The conditions of anodic to aluminum. 13

Tab. 4.1 The chemical reactions and Nernst's law when aluminum is immersed in aqueous solution. 40

Tab. 4.2 The Nernst's reactions of Al in aqueous solution when Al^{+3}, AlO_2^- ions concentration are 10^{-6}. 41

Tab. A.1 The chemical reactions and Nernst's law when titanium is immersed in aqueous solution. 141

List of figure captions

Fig. 2.1 The I-V curve of etching, polishing and pitting sections. 7

Fig. 3.1 Schematic diagram of electropolishing and anodization setup. 20

Fig. 3.2 The optical microscopy image of aluminum surface after electropolishing. 20

Fig. 3.3 The first anodization films were removed by mixture of 6 vol% H_3PO_4 and 1.8 wt. % chromic acid (CrO_3) solution, the ordering nanopattern retained on the aluminum surface. The electrolyte of first anodization is by 10 % H_2SO_4 (a), by 3 % $C_2H_2O_4$ (b), and by 2 % H_3PO_4 (c). 23

Fig. 3.4 The surface morphology of AAO compartment between the first anodization (a), and the second anodization by 3 % oxalic acid electrolyte. 24

Fig. 3.5 The SEM image of 2nd anodization AAO after pore widening by 6 % phosphoric acid. 24

Fig. 3.6 The SEM images of AAO bottom view of barrier layer; anodization by 10 vol. % H_2SO_4 electrolyte (a), anodization by 3 vol. % $H_2C_2O_4$ electrolyte (b), and anodization by 2 vol. % H_3PO_4 electrolyte (c). 25

Fig. 3.7 The flow sheet of AAO process by two steps anodization. 26

Fig. 3.8 SEM image of AAO forming on the 99.7% purity aluminum foil through 1st anodization, 4 hr at 600°C annealed in the air furnace, and 85 min. 6 vol% H_3PO_4 pore widening at 30°C for 85min. processes. 27

Fig. 3.9 The flow sheet of AAO process by 99.7 % purity aluminum foil. 28

Fig. 3.10 The experiment equipment for making metal nanowire. 30

Fig. 3.11 SEM image of Sn melt inside AAO, which formed Sn nanowires: (a) top view, (b) cross-section view. 31

Fig. 3.12 The Sn nanospheres formed by thermo expansion process. 33

Fig. 3.13 The flow sheet of Sn nanospheres fabricated by oil reflowing. 34

Fig. 3.14 Sn spheres forming on the AAO surface by E-beam deposition process. 34

Fig. 3.15 The SEM image of nanospheres on AAO by thermal immersion process. 34

Fig. 4.1 The OM images of mechanical polishing (a), and chemical polishing on pure Al (b). 35

Fig. 4.2 The OM images of EP Al surface without annealing before. 36

Fig. 4.3 The OM images of Al surface after annealing and EP. 36

Fig. 4.4 The OM images of the defects on Al surface after EP; plastic deformation when pre-polishing by Al_2O_3 powder (a), pitting by high voltage (b), and waviness by without stirring. 37

Fig. 4.5 The curve of voltage vs. current density of Al EP. 37

Fig. 4.6 The curve of time vs. current density of Al EP. 37

Fig. 4.7 The OM images of insufficient EP time; 5 sec (a), 10 sec (b), 35 sec (c), 50 sec (d), 500 sec (e), 620 sec (f). 38

Fig. 4.8 The OM images of excessive EP time; 1000 sec (a), 1200 sec (b),

1400 sec (c). 38

Fig. 4.9 The Pourbaix diagram of Al in electrolytes. 43

Fig. 4.10 Two steps anodization to fabricate AAO using high purity (99.999%) Al foil as substrate in 10% H_2SO_4 solution at 18V, then AAO through pore widening using 5 vol. % H_3PO_4 solution for 0 min (a), 5 min (b), 10 min (c), 15 min (d), 20 min (e), 25 min (f), 30 min (g), 35 min (h), 40 min (i). 46

Fig. 4.11 Two steps anodization to fabricate AAO using high purity (99.999%) Al foil as substrate in 3% CH_2O_4 solution at 40V, then AAO through pore widening using 5% H_3PO_4 solution for 0 min (a), 5 min (b), 10 min (c), 15 min (d), 20 min (e), 25 min (f), 30 min (g), 35 min (h), 40 min (i). 47

Fig. 4.12 SEM images of AAO made from aluminum foil (99.7% purity). The anodized alumina layers were prepared by anodization in 3% oxalic acid at 25°C at 40 V. Bottom view of nanopores with barrier layer before pore widening (a). Non-ordered nanopores appear on top view (b). Top view of AAO with subholes after pore widening (c). The pore structure was destroyed easily without heat treatment, even when the pore widening time was only 50 min. (d). 49

Fig. 4.13 SEM images of AAO bottom views. Barrier layer image (a), barrier layer was etched by 5 wt. % H_3PO_4 solution at 30°C for 30 min (b), for 40 min (c), for 50 min (d), for 60 mim (e), and for 70 mim (f). 50

Fig. 4.14 SEM images of AAO after heat treatment at 600°C; the pores were sintered, then through pore widening, the pores became ordered. (a) The pores in the AAO were sintered and sub-holes was disappeared after 4 hours heat treatment; (b) the pores of AAO expanded after pore widening for 5 min., (c) the pores of AAO expanded and pores became to ordered after pore widening for 50 min., (d) after pore widening for 70 min. (e) the pores of hexagonally

packed structure on AAO after pore widening for 85 min. (f) AFM image of close-packed ordered nanostructure after self-repair, (g) AAO with a thickness of 9 um. 51

Fig. 4.15 The top view, cross-section view, and bottom view of AAO, and hexagonal pattern on aluminum surface. (a) Top view of low magnification image of long-range ordered channel array with dimensions of the order of millimeters, (b) bottom view of barrier layer with hexagonally packed structure, (c) cross-sectional view with base of straight tube on the bottom barrier layer, (d) hexagonal pattern on aluminum surface when AAO was removed from substrate. 53

Fig. 4.16 Schematic diagram showing array nanochannel in AAO is through O and Al diffuse into the AAO. 56

Fig. 4.17 Self-diffusion distance of Al_2O_3 with diffusion time at 600^{o}C. 57

Fig. 4.18 On AAO without an Al substrate, the AAO structure was destroyed after heat treatment at 600^{o}C for 4 hours. 57

Fig. 4.19 X-ray diffraction spectrum of AAO before annealing: (a) amorphous AAO, (b) $AlPO_4$ peaks in the amorphous AAO, after pore widening. 59

Fig. 4.20 X-ray diffraction spectrum of AAO crystallized toγ-phase of Al_2O_3 after annealing. 60

Fig. 4.21 Schematic diagram of self-repair. (a) The holes in AAO were random when Al with a purity of 99.7% was used after anodization, (b) the pores decrease in size towards the center of pore after heat treatment, (c) the pores were expanded by upon pore widening, (d) after long-term pore widening, uniform-sized close-packed ordered nanopore on AAO. 60

Fig. 4.22 Al-Si binary phase diagram 61

Fig. 4.23 Marco OM image of AAO on the 6 inch Si wafer (a), and 4 inch glass substrate (b). 64

Fig. 4.24 SEM images of AAO on the 6 inch Si wafer (a), and 4 inch glass substrate (b). 64

Fig. 4.25 the cross-section SEM images of AAO on Si wafer with barrier layer (a), and without barrier (b). 65

Fig. 4.26 The transparency of 1μm thickness of AAO on the glass substrate. 65

Fig. 4.27 The SEM images showed the failed AAO when the unsuitable conditions used in anodization; local heat (a), thermo cracking (b), defects (c), pitting (d), grain boundary (e), sub-holds (f), random (f), and breaking (g). 68

Fig. 4.28 The schematic diagram of metal/ceramic composite of experimental sample. 70

Fig. 4.29 The schematic diagram of AAO structure (a), to inject melt into the AAO (b), nanowires formed in the AAO (c), removed Al substrate (d), removed barrier layer(e), and removed partial of AAO (f). 71

Fig. 4.30 The basic Sn bulk material characteristics of micro morphology (a), composition (b), and melting point (c) were detected by OM, XRD, and DSC. 73

Fig. 4.31 The curve of critical pressure for melt injected in nanochannel; applied pressure increasing with pore size decreasing. 74

Fig.4.32 Top and bottom view SEM images of filling ratio of Sn inside AAO (ψ=60nm). Top view images of applied pressure 30bar (1750Kg) (a), 35bar (2042Kg) (b), 50bar (2817Kg) (c), and bottom view of applied pressure 50bar (2817Kg) (d) on the Sn melt. 75

Fig.4.33 Top and bottom view SEM images of filling ratio of Sn inside

AAO (ψ=15nm). Top view images of applied pressure
100 bar (5835 kg) (a), 140.1 bar (8175 kg) (b),
200 bar (11671 kg), and bottom view of applied pressure
200 bar (11671 kg) (d) on the Sn melt. 76

Fig. 4.34 The SEM images of bottom AAO with partial Sn inside; barrier layer retains on AAO (image right side), Empty holes (black), and Sn nanowires inside the holes (white). 77

Fig. 4.35 The SEM images of bottom AAO showed the original (a) AAO with low filling ratio of Sn inside that Sn inside AAO made AAO color from black changed to white. Improved the filling ratios of Sn inside AAO by high temperature (450 ^{o}C for 1 hr) drying (b) and high temperature (450 ^{o}C) vacuum (10^{-3} torr) treatments; 10 min (c), 15 min (d), 20 min (e), 25 min (f). 78

Fig. 4.36 SEM image of Sn melt inside AAO, which formed Sn nanowires: (a) top view, (b) cross-section view, high magnification of cross-section (top) view, and high magnification of cross-section (bottom) view. 79

Fig. 4.37 DSC curves of the melting point on bulk Sn is 231.7 ^{o}C, 60 nm diameter and 15 nm diameter Sn nanowires decrease to 227.1 ^{o}C and 224.1 ^{o}C. 80

Fig. 4.38 DSC curves of the melting point on bulk Bi is 272.2^{o}C, 60 nm diameter and 15 nm diameter Bi nanowires decrease to 265.3 ^{o}C and 256.6 ^{o}C. 80

Fig. 4.39 The SEM images of Sn nanowires were collected on the Cu Cu grid after AAO was dissolved in 0.2% NaOH solution; low magnification image (a), and high magnification image (b). 81

Fig. 4.40 TEM micrograph of a randomly selected single nanowire (60 nm). The black circles indicate the areas from which the electron diffraction pattern (ED) was taken. Note that the ED patterns remain the wire length. The zone axis in this case was [021] and the growth direction is [100]. 82

Fig. 4.41 TEM micrograph of a randomly selected single nanowire (15 nm). The zone axis in this case was $[\bar{1}11]$ and the growth direction is [101]. 83

Fig. 4.42 XRD patterns of large scale AAO/Sn nanowire composite. 84

Fig. 4.43 A schematic side view diagram of Sn inside AAO template; with Al substrate and alumina barrier layer (a), without Al substrate and alumina barrier layer (b). 86

Fig. 4.44 SEM images of sample bottom view; after aluminum substrate was removed, the barrier layer presents (a); furthermore, grain boundary of barrier layer etched by 6% H_3PO_4 solution for 20min at 23°C (b); the solution reacted to the metal Sn for20min at 23°C (c). 87

Fig. 4.45 SEM images of AAO (ψ=180nm) sample bottom view; barrier layer was removed by 0.2 wt% NAOH at 23°C for 4hr (a), 4hr 30min (b), 5hr (c), 5hr 30min (d). 88

Fig. 4.46 SEM images of AAO (ψ=60nm) sample bottom view; barrier layer was removed by 0.2 wt% NAOH at 23°C for 2hr (a), 2hr 30min (b), 3hr (c),3hr 30min (d). 90

Fig. 4.47 SEM images of AAO (ψ=15nm) sample bottom view; barrier layer was removed by 0.2 wt% NAOH at 23°C for 30min (a), 40min (b), 50min (c), 60min (d). 91

Fig. 4.48 SEM image of the order nanopattern retains on the Sn bulk surface. 92

Fig. 4.49 Sn whiskers and particle growth on 60nm diameter pore of AAO

(with Sn inside) surface, heating up and cooling down by Differential Scanning Calorimetry (DSC); clean surface of AAO at 25^{o}C (a), nanocrystals forming at 220^{o}C (b), whiskers forming at 226^{o}C (c), whiskers agglomeration at 228^{o}C (d), whiskers agglomeration and forming a sphere at 229^{o}C (e), few whiskers connect to sphere at 230^{o}C (f), micro scale sphere forming at 231^{o}C (g), most spheres and few whiskers on the AAO (h), micron and sub-micro spheres on the AAO at 240^{o}C (i). 95

Fig. 4.50 The SEM images of Sn nanowhiskers form on the AAO (a), and thehigh magnification image (b). 96

Fig. 4.51 The SEM images of Sn nanosphere on the nanowhiskers (a), and the the high magnification image (b). 98

Fig. 4.52 The Equilibrium curves of partial oxygen pressure (a) and Gibbs free energy (b) between 150 ^{o}C to 300^{o}C in Sn-SnO and Sn-SnO_2 system. 100

Fig. 4.53 SEM image of AAO template with nanoscale roughness of nanopillars and nanopores. 102

Fig. 4.54 The SEM images of rapid solidification of Sn nanospheres on the AAO surface. 102

Fig. 4.55 The SEM image of Sn nanospheres with diameter between 90 and 300 nm. 103

Fig. 4.56 Histogram showing the quantitative size distribution of nanospheres. 103

Fig. 4.57 DSC curves showing the melting points of pure Sn and the Sn nanosphere to be 231.91^{o}C and 227.15^{o}C, respectively. 104

Fig. 4.58 SEM image of Sn nanospheres collected by vibrate in alcohol. 104

Fig. 4.59 TEM image of Sn nanosphere (a), and diffraction pattern with tetragonal crystal structure of [101] zone axis (b). 105

Fig. 4.60 SEM images showing the AAO surface without any Sn sphere after Sn nanospheres were collected by vibrate, as well as remaining shallow concave wells on the AAO surface. 106

Fig.4.61 SEM images showing Sn balls cracked under a fast quenching rate (235^{o}C to 0^{o}C). 106

Fig.4.62 SEM images showing Sn balls sintered together under the high temperature (300^{o}C). 106

Fig. 4.63 Molten metal became cohered and covered AAO when heat treatment time was insufficient, so that nanoparticles had difficulty forming on AAO. 107

Fig. 4.64 Schematic diagrams show oxide film existence between melt and AAO, which difficully in nanoparticle formation on AAO; (a) that macro schematic of oxide film covered on surface of melt, (b) micro schematic of oxide film that prevented melt nucleation on the AAO. 108

Fig. 4.65 Schematic diagrams showing free oxide on interface of melt-AAO, the nanoparticles formed on AAO; (a) macro schematic of free oxide film on interface of AAO-melt, (b) micro schematic of melt nucleated on AAO. 108

Fig. 4.66 SEM image showing that melt solidified and nucleated to form nanoparticles on AAO. 109

Fig. 4.67 Homogeneous nucleation of critical radius and Gibbs free energy of Pb-Bi eutectic are 2.7 nm and 128×10^{-24} joule at 398 K. 109

Fig. 4.68 Nanoparticle size in a concave was much larger than that on surface of

AAO. 113

Fig. 4.69 Various numbers and sizes of nanoparticles in concaves; (a) diameters of nanoparticles on pore wall of concave were larger than those on surface of AAO, (b) a smooth and shallow indent, numbers and the size of nanoparticles inside were similar to those on surface of AAO, (c) large number of nanoparticles formed in deep and rough concave, (d) small number of large nanoparticles formed in deep concave. 116

Fig. 4.70 SEM image of nanoparticles subjected to ultrasound. 117

Fig. 4.71 Schematic diagrams of AAO with pore radius and pore wall width denoted R, W, and L, respectively. 117

Fig. 4.72 Nanoparticles in smooth concave; (a) diameter and number of nanoparticles in concave were similar to those of nanoparticles on AAO surface, (b) high magnification image, initially isolated nanoparticle, and parts of large sintered ball formed. 118

Fig. 4.73 SEM image of sintered nanoparticles in deep concave. 119

Fig. 4.74 Schematic diagram of surface area with various dept of concave. 120

Fig. 4.75 Latent heat in the concave of AAO increased with depth of semi-cup indent. 120

Fig. 4.76 SEM and schematic diagrams of nanoparticles nucleated on the corners of AAO and grown on pore of AAO; (a) nanoparticles nucleated on six nooks of AAO, (b) six isolated nanoparticles grew, (c) six nanoparticles assemble to form a large nanoparticle. 121

Fig. A.1 The optical microscopy image of titanium surface after electropolishing. 133

Fig. A.2 The SEM image of ATO. 133

Fig. A.3 The flow sheet of ATO process. 134

Fig. A.4 The electro-polishing curve of titanium. 136

Fig. A.5 The OM images of EP onβphase (a), andαphase Ti surface (b). 136

Fig. A.6. The optical micrographs of electro-polishing progress from 1 to 21 minutes on the titanium surface; (a) original titanium surface; (b)-(h) insufficient polishing, 1 to 13 minutes; (i) suitable polishing, 14 minutes; (j)-(k) excess polishing, 17 to 21 minutes. 138
