Abstract ---------- Ⅱ

Contents ---------- Ⅲ

List of Tables ---------- Ⅳ

List of Figures ---------- Ⅴ

Chapter 1:

Introduction ……...……...…1

1.1 General introduction ……...……...1

1.2 Introduction of photoelectric device ……....2

1.3 Solid-state electronic devices for biosensing ……...…..4

1.4 Motivation ……....8

Chapter 2: Device principles and operations ..……..……10

2.1 Fundamentals of the MSM-PD ……....10

2.2 Semiconductor physics of the MSM-PD ……..……11

2.2.1 Schottky diode ……..……11

2.2.2 Current Transport Mechanism ……..……14

2.3 Characteristic parameters of MSM-PD ……...15

2.3.1 Quantum efficiency …….……15

2.3.2 Responsivity …….……15

2.3.3 Response time ……..15

Chapter 3: Experiments ……17

3.1 Device fabrication techniques ……..……17

3.1.1 Fabrication process ……..…….……19

3.1.2 E-beam lithography …….……19

3.1.2.1 Ideas for device layout …….…..……19

3.1.2.2 Introduction of proximity effect …….…...20

3.1.2.3 E-beam proximity effect correction method …..21

3.1.3 Lift-off process …….……26

3.1.3.1 Introduction of lift-off process ……..26

3.1.3.2 The problems during lift-off ……..28

3.1.3.3 Solutions for these problems ……30

3.1.4 Procedure for reaction chamber ……...…....35

3.2 Immobilization process (luminol) …….……...36

3.3 Process of gold nanoparticles synthesis ……...……39

3.3.1 Gold nano particles synthesis process ……...…...39

3.3.2 Immobilization of gold nanoparticles …..……40

Chapter 4: Results and discussions ……...…….42

4.1 Device

performance ……..…...42

4.1.1 Photo response without anti-reflection layer ……...….43

4.1.2 Device stability ……..……..…..44

4.1.3 Symmetric characteristic of MSM-PD ……...……..45

4.1.4 Photo response with anti-reflection layer ……46

4.1.5 Sampling mode measurement ……..……50

4.2 Luminescence application ……..……..51

4.2.1 Real-time sensing for Luminescence ……..……52

4.2.2 Calibration line and minimum detection limit ……....56

4.2.3 Average molecules per unit area …….....60

4.3 Gold nanoparticle detection ……..……...61

Chapter 5: Conclusions ……..……...68

List of Tables

Table 1. The specific range of absorbance of light wavelength for various types of semiconductor materials

List of Figures

Chapter 1

Figure 1-1. The U.S. market for biosensors and bioelectronics

Figure 1-2. Incident light results in electron - hole pairs in semiconductor Photoconduction device under bias

Figure 1-3. Incident light results in electron - hole pairs in semiconductor Photovoltaic detector under bias

Figure 1-4. Nanowire sensor for detection of ATP binding (a) real-time sensing, (b) calibration line of this device

Figure 1-5. Dielectric loss data for two different nanogaps and a large commercial dielectric cell

Figure 1-6. Schematic diagram of then opto-electric DNA chip at the level of 1 pixel

Figure 1-7. Schematic of detection platform

Chapter 2

Figure 2-1. (a) schematic symbol, (b) 1-D schematic, (c) top view, and (d) cross-sectional view

Figure 2-2. Schottky diode under thermal equilibrium condition, (a) metal and n-type semiconductor($\phi_m > \phi_s$) (b) metal and p-type semiconductor ($\phi_m < \phi_s$)

Figure 2-3. (a) schematic diagram of MSM-PD, (b) charge distribution under low bias voltage, (c) electric field distribution under low bias voltage, (d) energy band diagram of MSM-PD

Figure 2-4. Current transport mechanism under forward bias

Chapter 3

Figure 3-1. Process flow chart of MSM-PD fabrication

Figure 3-2. (a)Full layout of MSM-PD, the dark area in the middle is the active area, the two squares in both side is contact pad, (b)Magnification image of active region, the active area contains 83 lines per side.

Figure 3-3. In-line SEM image of interdigitated lines by E-beam lithography but without any correction method (dark color is silicon; white color is resist)

Figure 3-4. In-line SEM image of interdigitated lines after EPC modification. The right-down areas are not exposed perfectly duo to underexposed. (dark color is silicon; white color is resist)

Figure 3-5. The In-line SEM image shows the resist width of 293nm. (dark color is silicon; white color is resist)

Figure 3-6. In-line SEM image of interdigitated lines, this correction method is by manually decreasing the line width of the layout. (dark color is silicon; white color is resist)

Figure 3-7. The line width is 323nm from In-line SEM measurement. (dark color is silicon; white color is resist)

Figure 3-8. Lift-off process flow chart

Figure 3-9. Optical microscopic image of interdigitated lines: soaking in etching solution of NMP for 4 days.

Figure 3-10. The SEM image of interdigitated lines (cross-touching leading to short circuits; width: space = 1:1)

Figure 3-11. The SEM image of adjacent region between semi-dense area (width : space = 1:3) and dense area (width : space= 1:1); (fragmented

lines leading to open circuit)
Figure 3-12. New process flow chart of lift-off by etching down unerlayer
Figure 3-13. The SEM image of adjacent region between semi-dense areas (width : space = 1:3) and dense areas (width : space= 1:1) by means of improvement method.
Figure 3-14. Rinsing in etching solutions for 4 days and then rinsing in SPM for 1 hour
Figure 3-15. Optical microscopic image of interdigitated lines. Condition: after performing sonication for 3 seconds
Figure 3-16. Optical microscopic image of interdigitated lines. Condition: after performing sonication for 6 seconds
Figure 3-17. Photo of PDMS mother mold
Figure 3-18. Photograph of MSM-PD as on-chip biosensor system
Figure 3-19. Schematic diagram of immobilization process flow
(a) SAM APTES, (b) Immobilization of biotin, (c) Immobilization of streptavidin, (d) Add substrate solution, (e) Schematic diagram of my system
Figure 3-20. The reactions in gold nanoparticles synthesis
Figure 3-21. The process flow of immobilization of gold nanoparticles

Chapter 4

Figure 4-1. Power intensity of halogen lamp measured by calibration photodiode
Figure 4-2. I-V characteristic before deposition of oxide anti-reflection layer
Figure 4-3. I-V characteristic indicates the device is stable. The

measurement of dark-current for 10 readings, the curve is the average value and the error bar is triple standard deviation.
Figure 4-4. I-V characteristic: Symmetric characteristic in positive and negative voltages.
Figure 4-5. I-V characteristic after deposition silicon oxide layer
Figure 4-6. The analysis of anti-reflection result by N&K
Figure 4-7. Sampling mode of MSM-PD. The device operation at -5V and the time interval is 4ms
Figure 4-8. Sampling mode of MSM-PD after SPM clean
Figure 4-9. Sampling mode of MSM-PD after immobilization of APTES
Figure 4-10. Sampling mode of MSM-PD after immobilization of biotin
Figure 4-11. Sampling mode of MSM-PD after immobilization of streptavidin
Figure 4-12. Real-time measurement after add substrate. (Immobilization of streptavidin-HRP catalyzed luminescent system)
Figure 4-13. Real-time measurement for non-immobilization luminescence. The mass of streptavidin is 100ng and dissolved in 10uL PBS solutions, and substrate solution is 90uL.
Figure 4-14. Real-time measurement for non-immobilization luminescence. The mass of streptavidin is 200ng and dissolved in 20uL PBS solutions, and substrate solution is 80uL.
Figure 4-15. Real-time measurement for non-immobilization luminescence. The mass of streptavidin is 1000ng and dissolved in 10uL PBS solutions, and substrate solution is 90uL.
Figure 4-16. Calibration line of MSM-PD on-chip biosensor.
Figure 4-17. Dark current (i.e. noise single) under PBS solution of the

MSM-PD on-chip biosensor
Figure 4-18. (a) SEM image of immobilization gold nanoparticles onto the oxide surface, (b) static analysis of gold nanoparticles size distribution by IPP software
Figure 4-19. I-V characteristic of the device after immobilization of APTES (Sweep mode)
Figure 4-20. I-V characteristic of the device after immobilization of gold nanoparticles (Sweep mode)
Figure 4-21. Absorption of gold nanoparticles dissolve in DI water measured by UV-Visible.
Figure 4-22. Reflection data of different surface by N&K measurement after each immobilization step.
Figure 4-23. The model about how to improvement the sensitivity for gold nanoparticles detection. The dotted area is around 520nm wavelength, the white area is the incident light of (a) Halogen lamp, (b) 520nm laser diode.
