Chapter 1 Introduction 1

Chapter 2 Basic theory 8

2-1 Type-II superconductors 8

2-2 Basic vortex physics 12

2-3 Simulation and results 14

Chapter 3 Fabrication process and measurement techniques 19

3.1 Sample preparation 19

3-1-1 E-beam lithography 21

3-1-2 Etching 25

3-1-3 Film growth and characterization 27

3-2 Measurements 29

3-2-1 Transport measurements 29

3-2-2 Magnetic and atomic force microscopy 31

Chapter 4 Results and discussion 32

4-1 Basic periodic pinning 32

4-1-1 Results of square array of pinning sites 32

4-1-2 Periodic Pinning basics 37

4-1-3 Pinning mechanism 42

4-2 Influence of lattice geometry 48

4-3 asymmetric pinning 51

4-3-1 asymmetric pinning properties for regular arrays 51

4-3-2 asymmetric pinning properties for spacing-graded arrays 55

4-2 Ratchet effect 65

Chapter 5 Conclusions 83

References 85

List of Figures

2-1 Schematic magnetic field verse temperature phase diagram …… 9
2-2 Numerical simulation of vortex positions at various matching fields for a square pinning array …… 17
2-3 Numerical simulation of vortex positions at various matching fields for a triangular pinning array …… 18
3-1 Schematic of the electron-beam lithography and lift-off process…… 20
3-2 Schematic diagram of the EB control system …… 21
3-3 SEM…… 22
3-4 Bonding pads were defined by photo lithography and Au was thermally evaporated onto a SiN-coated silicon substrate. We used these patterned structures as starting electrodes in the present method.…… 23
3-5 Scanning electron micrograph of a SiN-coated silicon substrate with holes. The holes are 200 nm in diameter and positioned on a square lattice with a lattice constant equal 500nm. The scale is given at the bottom of the picture.…… 26
3-6 Dc sputtering system.…… 28
3-7 Cross section of the niobium film.…… 28
3-8 SQUID system…… 30
3-9 AFM…… 31
4-1 Field dependence of the resistance and critical current for a Nb film with a square array of defects at T=8.75 K.…... 35
4-2 I – V characteristics for a triangle lattice at T=8.73 K under various magnetic fields applied perpendicular to the film plane. The arrows represent the crossover currents between integer and half-integer matching fields. …… 36
4-3 Magnetoresistance for different injected current in a Nb film with a square array of defects at T=8.75 K. …… 36
4-4 Magnetic force micrograph of a square lattice of submicron magnetic dot (a) before magnetization, and after magnetization along axis of the dots. 40
4-5 Critical current density in function of magnetic field at T/Tc=0.985 for a superconducting film covering the triangular magnetic dot array in the single-domain and in the multi-domain state. …… 40
4-6 Critical current density in function of magnetic field showed the asymmetric properties for different magnetism. …… 46
4-7 Three configurations of the magnetic dot arrays used in our simulation: (a) FM, (b) AFM, and (c) AFM2×2. The black open and gray filled circles are the up- and down-magnetized dots. The dotted lines indicate the unit cells for each configuration. …… 47
4-8 SEM micrographs for a Nb film with different geometries of defect array. …… 48
4-9 Critical current as a function of the magnetic field for a Nb film with different geometries of defect array. …… 49
4-10 Critical current as a function of the magnetic field for a Nb film with a triangular array of defects. …… 53

4-11 The vortices distribution ~filled circles! and pinning sites (open circles) for (a) the incommensurate row and (b) the interstitial flowing channel…. 53
4-12 The trajectories of vortices for n = 2 for case A (a) and case B (b) for driving force just above the critical depinning force. The open circles represent the pinning sites. ……... 54
4-13 SEM micrograph. Sample A is triangular array of pinning sites and the sample B is graded ones. ……. 56
4-14 SEM micrograph shows the top view of the small gradient sample…… 57
4-15 SEM micrograph shows the top view of the large gradient sample……. 58
4-16 dc voltage vs dc applied current for a Nb film with graded pinning site's density at first matching field. …… 60
4-17 (a) MR curves for injected positive/negative current at T= 8.20 K. The inset (b) and (c) show sharp and shallow dips around the first matching field. ……..… 61
4-18 Magnetoresitance curves MR of a niobium film with spacing-graded array of holes in two opposite direction of dc current (negative current filled square, positive current open circle). (a) T = 7.90 K, (b) T = 7.86 K…….... 64
4-19 Dc voltage drop Vdc as a function of ac current Iac for different applied magnetic fields. …… 74
4-20 Dc voltage drop as a function of ac current for different temperature……. 74
4-21 The Vdc(Iac) for different applied magnetic field at T = 8.20 K……. 75
4-22 The comparison between the maximum rectified value (Vmax) and Magnetoresistance as a function of applied magnetic field……... 77
4-23 Magnetoresistance as a function of applied magnetic field…….. 77
4-24 Dc voltage drop Vdc as a function of ac current Iac for different magnetic field. Panels (a)-(b): H<H1. Panel (c): H=H1. Panel (d)-(f): H>H1. H1 is the first matching field and is equal to 150 Oe……. 81
4-25 (a) The dependence of the maximum/minimum rectification dc voltage (Vmax) in the Vdc(Iac) curves of the peak/dip for different applied magnetic field. (b) the position of peak (open symbols) and dip (filled symbols) as a function of applied magnetic field……. 82
